TITLE: Investigation into the causes of longitudinal thickness nonuniformity and its elimination during continuous strip rolling

SOURCE: Stal', no. 2, 1966, 146-151

TOPIC TAGS: sheet metal, steel, carbon steel, steel forging, metal rolling / St2 steel, 08kp steel, 15kp steel, St3 steel

ABSTRACT: The parameters which determine the thickness of continuously rolled sheets were investigated. The investigation was carried out on the sheet-metal rolling mill 1450 of the Magnitogorskiy Metallurgical Concern (Magnitogorskiy metallurgicheskiy kombinat). The effect of rolling temperature and tension on the thickness uniformity of low-carbon steel sheets was studied. The stand temperatures were calculated after the method of P. Lee, R. Sims, and H. Wright (Iron and Steel, 1962 v. 35, No. 14, p. 624-627), and the deformation resistance as a function of the rate of deformation, the temperature, and magnitude of compression was calculated after V. I. Zyuzin, M. Ya. Brovman, and A. F. Mel'nikov (Soprotivleniye deformatsii stalei pri goryachey prokatke, Izd. Metallurgiya, 1964, str. 211-233). The experimental results are presented in

Card 1/2

graphs and tables (see Fig. 1).

Fig. 1. Dependence of the decrease of sheet thickness Δ on the change in the position of compression bolts z , for stands V-IX, for additional pressure applied to these stands.

Change in the position of compression bolts $z, m.$

The following relationship between the distribution of the rolling stand pressure and the change in the sheet thickness was established

$$\Delta h_i = z_n \sum_{i=0}^m \frac{v_n}{v_{n+1}} \cdot \frac{1}{w_{n+1}}$$

where Δh_i is the change in longitudinal thickness, z_n - the position of compression bolt, v_n - rate of rolling, and $w = z/\Delta$. The indexes n and $n + 1$ refer to the stand numbers. It is concluded that an accurate knowledge of the relationship w permits an accurate control of sheet thickness. Orig. art. has: 2 tables, 5 graphs, and 2 equations.

PRACTICES AND PROBLEMS 113

Technological aspects of steel making using Kusso titan-magnetic iron. E. M. Karlik and G. V. Savelyev. *Kachestvennaya Stal* 4, No. 7-8, 37-92 (1963). *Met. sladki (in Metals & Alloys)* 8, 10. Methods for utilization of V contained in iron can be divided into 2 groups, complete oxidation of V in slag with subsequent recovery of the metal, or partial oxidation of V into slag and partial retention in the steel produced. The process, as conducted in a basic open-hearth furnace, consists in melting without lime and with ore addn. The first slag formed carries up to 15% V and is removed. Then the usual slag is formed and heat finished. The total recovery is about 60% V. Many heats of this type were made, all without satisfactory results. Five exptl. heats in acid open-hearth furnaces showed reduction to about 0.15% V in the metal and produced slags with about 3% V. Expts. in an acid converter similar to that of von Seth (C. A. 21, 2088) were not successful. M. W. B.

Yel'yashevich, A.B., Karlik, Ye. M., and Shayovich, L.L.

Ekonomika sotsialisticheskogo mashinostroyeniya (The Economics of Socialist Machine Building) Moscow, Mashgiz, 1957. 475 p. 15,000 copies printed.

Reviewers: Novozhilov, V.V., Prof., Dr. of Economic Sciences, and Stepanov, G.A.; Ed. of Publishing House: Leykina, T.L.; Tech. Ed.: Speranskaya, O.V.; Managing Ed. of Leningrad Branch of Mashgiz: Bol'shakov, S.A.

PURPOSE: This book is a textbook for undergraduate students enrolled in engineering courses, as well as for personnel employed by planning and design organizations and by machine-building plants.

COVERAGE: The co-authors of this book endeavored to give a systematic presentation of the problems and development of socialist machine-building as a science. Though no complete

Card 1/90

The Economics of Socialist Machine Building 469

course in the economics of socialist machine-building is offered, a discussion is presented of its basic problems and the following aspects are examined: (1) scope and rate of machine-building development; (2) ways of improving machinery systems and the natural law governing the development of the machine-building industry; (3) personnel and organization of labor; (4) the natural law governing the progress of specialization and cooperation; (5) concentration and distribution of machine-building production; (6) problems concerning the effective use of fixed and turnover assets; (7) economic accountability of machine building. Chapters I, II, III, VII, IX, X, and XI were written by Professor A.B. Balashev; chapters IV, V, and XII, by Docent L.L. Shayovich; and chapters VI and VII by Docent Ye. M. Karlik. It is pointed out in the preface that the co-authors of this book constitute the nucleus of the Department of Machine-building Economics of the Leningrad Institute of Engineering Economics.

PROCESSES AND PROPERTIES INDEX

The influence of deoxidation on the properties of cupola iron. P. A. Karkhanin. *Izdatok Detal' 12*, No. 6, 3-6 (1941); *Chem. Zentr.* 1043, I, 93. The following 2 alloys are suitable deoxidizing agents for liquid cast iron: (1) Si 35-45, Al 30-40%; and the remainder Fe and (2) Si 12-15, Al 12-16% and the remainder Fe. The first alloy is prep'd from ferrosilicon and Mn, the 2nd, from CaSi and Al. The deoxidizing agent prevent a white solidification of the cast iron and make possible a fine grain structure in thin-walled castings which otherwise would solidify white because of their chem. structure and conditions of cooling. Moreover, the Si content of the cast iron is somewhat increased by the deoxidizing agent and this results in an increased sepn. of graphite and a uniform distribution of the graphite throughout the cross section of the casting. In thin-walled castings and those of medium thickness the effect of the deoxidizing agent is to improve the mech. properties with increasing wall thickness (10-50 mm.). For greater wall thickness (about 75 mm.) the mech. properties of deoxidized and nondoxidized castings are practically the same. With cast iron produced from ore mixts. to give a white or semicwhite fracture the use of a deoxidizing agent sharply reduces the hardness. However, the hardness of such cast iron is not less than that of a high-grade cast iron having a pearlite groundmass.

My observations of the structures of the small
units of the People's Liberation Army (PLA) in
North Vietnam (see summary) were the result of traffic
patrols of the area around Lang Son. A number of CIA
agents and members of the People's Liberation Army
were interviewed. In addition, I was able to observe
the following: The structures of the small units
and the structures of the larger units of the PLA
are roughly the same. All these structures were
approximately 20' x 20' (6m x 6m). Some
were similar to those of the infantry, and others had
a more elaborate structure. The smaller units
had a single entrance, while the larger units
had two entrances. The structures were built
out of mud and sticks, and were very simple.
The larger units had a more elaborate structure,
with a single entrance, and were built out of
mud and sticks. The smaller units had a single
entrance, and were built out of mud and sticks.

TITLE:

On the Relation Between the Coefficient of Viscosity and the Molecular Structure of Liquids (O svyazi koeffitsiyenta vyazkosti so strukturoy veshchestva v zhidkom sostoyanii)

PERIODICAL:

Doklady Akademii Nauk SSSR, 1957, Vol. 114, Nr 2, pp.361-364
(USSR)

ABSTRACT:

The relationship between the coefficient of viscosity and other physical properties, and particularly the structure of the substance in its liquid state are of great interest both for the development of the theory of the liquid state and of the viscosity, but also for the practical aspects of physical-chemical analysis. However, this set of interrelationships has not yet been clarified. On the one hand, the knowledge of the structure of liquids required for this purpose is lacking, and on the other hand the physical properties of the structure of liquids have not been investigated in sufficient detail. The authors of the paper under review made the attempt to overcome the difficulties, which are encountered

On the Relation Between the Coefficient of Viscosity and the Molecular Structure of Liquids

in clarifying the relationships between viscosity and structure etc., by an economical selection of the objects of their investigation. For this purpose, also other properties were studied that are in some relationship with the structure. The objects were selected from the point of view of the similarity of their molecular structures. The following properties were studied within a wide temperature range: density, heat of vaporization, molecular dispersion of light, and critical temperature. It was demonstrated that the curves of temperature dependence of the viscosity and of the heat of vaporization are placed the higher, and the curves of compression are placed the lower, the higher the critical temperature of the substance under consideration. It was also proved that the interrelationship between viscosity and other properties connected with the structure, on the one hand, and the critical temperature, on the other hand, is a consequence of the periodic law of Mendeleev. The analysis of the curves of atomic distribution of the isoviscous solutions, as well as the analysis of the curves of intensity, show complete coincidence. Therefore it follows that liquids with identical coefficients of viscosity (isoviscous liquids) also have

Title : Solution of the linearized axially symmetrical problem on the point of an explosion in a medium of variable density

Periodical : Dok. AN SSSR 101/6, 1009 - 1012, Apr. 21, 1955

Abstract : A solution is presented on the problem of a strong explosion at a point in a gas, the density of which, in the undisturbed state, is expressed as follows: $\rho_i = \rho_{01} - \epsilon r^k = \rho_{01} - \epsilon r^k \cos^2 \theta$,

where r is a distance between a point and the center of the explosion; θ is a latitude of the point from the axis (Oz), and ρ_{01} , ϵ & k are constants. Two USSR references (1946 and 1954).

TITLE: Linearized Problem on the Propagation of a Strong Explosion
in an Inhomogeneous Atmosphere

PERIODICAL: Vestnik Moskovskogo universiteta. Seriya matematiki, mekhaniki, astronomii, fiziki, khimii, 1959, Nr 4, pp 27-39 (USSR)

ABSTRACT: The first three paragraphs are already published by the author
[Ref 2]. The author considers a strong point explosion in a
gas the density of which is variable according to the law
$$\rho = \rho_0 (1 - \epsilon z^{\alpha})$$
 (z - height). The linearized problem is reduced
to the solution of a system of four ordinary differential equations
of first order. § 4 and § 5 of the present paper are devoted to
the solution of this problem. The author gives a series
arrangement under consideration of the fact that the coefficients
of the system have a simple pole; but it turns out that the
obtained series converge very slowly so that the numerical
solution is recommended. The principal difficulty is the
determination of certain constants since in general it is not

TITLE: On the Interaction of Strong Explosion Waves With an
Electromagnetic Field ✓

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 133, No. 4,
pp. 764-767

TEXT: The first part of the paper deals with the investigation of a point explosion in an ideal gas with infinitely large electrical conductivity, assuming the existence of a weak homogeneous magnetic field.¹ Owing to the weak magnetic field, the motion of the medium can be neglected in first approximation, and the problem has an axial symmetry on account of the homogeneous magnetic field. Proceeding from the induction equation, the equations (3) are obtained for the radial and the transverse components of the magnetic field, and are then discussed. An already known formula is given for the calculation of the current in the zone of gas motion. In the second part, the authors discuss the emission of electromagnetic waves caused by strong shock

waves in conducting media within an electric or magnetic field, and also the increase in the electrical conductivity of the gas behind the wave front of the shock waves caused by the interaction of the above electromagnetic waves with the shock waves. It is assumed in the further tasks that the electrical conductivity is infinitely large behind the shock wave front, but vanishing in front of it, and furthermore, the influence of the electric or the magnetic field on the gas motion is neglected due to the smallness of the electromagnetic field. Proceeding from the assumption that the electric and magnetic field strengths are equal in front of and behind the shock wave, the vector product (4) is obtained for the field strength in front of the shock wave. Plane waves are examined next, with \vec{E} parallel to the Y-axis and \vec{H} parallel to the Z-axis. (6) is then obtained for (4) and it is shown that H_z and E_y also satisfy equations $E_y + H_z = \Phi(\xi)$, $E_y - H_z = F(\eta)$, besides the wave equations. Here, $\xi = x - ct$, $\eta = x + ct$, $\Phi(\xi)$ and $F(\eta)$ are arbitrary functions, and c is the light velocity. Finally, the propagation of a plane shock wave and a strong explosion on a plane are investigated as concrete examples. In the first example, expressions are found for

$H_{z1}(x,t)$ and $E_{y1}(x,t)$ (index 1 refers to the zone in front of the shock wave), as well as for H_z for the zone of the gas motion behind the shock wave front. Similar formulas are obtained for the second example. The results obtained here can be used for determining the parameters of a gas-dynamic shock wave, if the parameters of the emitted electromagnetic wave are known. There are 5 Soviet references. ✓

TITLE: On the General Theory of Axisymmetric Motions of a Gas
PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 133, No. 5,
pp. 1049 - 1052 ✓
TEXT: The author investigates a class of axisymmetric irregular adiabatic motions of an ideal gas, the characteristics of which may be represented as an expansion in positive powers of the linear coordinate. The author proceeds from the equation system (1) for gas dynamics in spherical coordinates, and writes down the solution (2) of this system in a general form. These solutions are expansions in positive powers of the radius r. After an extensive calculation, the author develops a system for the coefficients of these power series, and indicates an algorithm for the calculation of these coefficients. L. I. Sedov (Ref. 1) is mentioned. There is 1 Soviet reference.

TITLE: On perturbations of the electromagnetic field under the action of a shock wave when conductivity is discontinuous

PERIODICAL: Akademiya nauk SSSR. Otdeleniye tekhnicheskikh nauk. Prikladnaya matematika i mehanika, v. 25, no. 3, 1961, 554 - 556

TEXT: Electromagnetic waves are investigated here by subjecting them to the action of spherical shock waves, spreading in a weak electromagnetic field. It is assumed that the mechanism of generation of the electromagnetic wave is related to the appearance of the discontinuity in conductivity on the passage of the shock wave through gas. Velocity of the shock wave $D(t)$ where t - time, is assumed known. If the subscript (1) denotes the region in front of the shock wave and subscript (2) the region behind it, then X

(1)

$$H_1 = H_2, \quad E_{1\tau} = E_{2\tau}$$

where E_τ - tangential component of electric field vector. In view of infinite conductivity of gas behind the shock wave, one has

$E_2 = -\frac{1}{c} v_2 \cdot H_2$ in a moving coordinate system, and

$$E_{1\tau} = -\frac{1}{c} [(v_2 - D) \cdot H_1]_\tau \quad (2)$$

in the stationary coordinate system. In the medium of zero conductivity and $\mu = \epsilon = 1$,

$$\frac{1}{c} \frac{\partial E}{\partial t} = \text{rot } H, \quad \frac{1}{c} \frac{\partial E}{\partial t} = -\text{rot } E. \quad (3)$$

The spherical shock wave is then considered. Initial magnetic and electric fields are taken to be H_0 and E_0 respectively. The spherical coordinate system is used (r, θ, ϕ) and θ is the angle of H . The following cases are then solved. 1) For $E_0 = 0, H_0 \neq 0$, and mo-

TITLE: An approximate method for solving explosion problems in certain ideally compressible media

PERIODICAL: Zhurnal prikladnoy mehaniki i tekhnicheskoy fiziki, no. 2, 1963, 132-134

TEXT: During explosions in certain ideal media, like water or water-containing ground, the motion of the liquid near the gaseous cavity agrees with the theoretical calculations of the displacement for the case of an explosion within an incompressible liquid. N. N. Kochina and N. S. Mel'nikova (Ref. 2: DAN SSSR, 1961, vol. 138, no. 2) enumerated the properties which distinguish media having the above-mentioned characteristics. Under such circumstances the compressibility substantially influences the fluid motion only within a relatively narrow region adjoining the shock wave containing large gradients of density, pressure, and velocity. The authors expect that the just mentioned facts are favorable for the existence of an approximate solution of the problem stated in the title. They start at time $t = 0$ with an instantaneously produced spherical volume of gas within

D

An approximate method...

a compressible medium at rest and of uniform density prior to the explosion. The gas is hot, highly compressed, and has an initial energy E_0 . The motion of the liquid behind the wave front is described by a spherically symmetric system of equations of gas dynamics. The results of the approximate calculations are compared with the exact solution of the automodel explosion problem presented by N. N. Kochina and N. S. Mel'nikova (Ref. 5: PMM, 1958, vol. 22, no. 1). The errors of the approximate results are within 20% of the exact values and should be considered satisfactory. The calculations can be extended to the case when the density of the region in the vicinity of the gas bubble is not constant but, e.g., depends on time.

PARAMETERS AND SHAPE OF A SHOCK WAVE FRONT PRODUCED BY AN
INTENSE EXPLOSION (USSR)

Korobeynikov, V. P., and V. P. Karlikov. IN: Akademiya nauk SSSR.
Doklady, v. 148, no. 6, 21 Feb 1963, 1271-1274. S/020/63/148/006/023

An approximate method is presented for calculating the parameters and shape of a shock wave in a point explosion in an inhomogeneous medium. Analytical relationships permitting determination of the shape are given, together with the law of its change with time. A theoretical determination of the wave front parameters based on data on the strong-detonation and asymptotic laws of shock wave decay is carried out. It is assumed that the point explosion takes place in an ideal gas (adiabatic index, 1.4). The calculated values of excess pressure $\Delta p_2/p_1$ are plotted in a graph. The results of a numerical calculation carried out on the "Strela" computer for the case when $h=8$ and $l \leq 3$ are given in a table. It is concluded that the method can be applied to the problem of explosions in a nonisothermal atmosphere. [ANB]

TITLE: Method for approximate calculation of the effect of the walls in cavity flow past a body in hydrodynamic tubes

SOURCE: AN SSSR. Izvestiya. Mekhanika zhidkosti i gaza, no. 4, 1966, 89-93

TOPIC TAGS: cavity flow, hydrodynamic theory, fluid flow

ABSTRACT: The article considers the homogeneous steady state flow of an ideal,

weightless incompressible fluid past an axisymmetric object in a cylindrical tube.

We introduce the control surface shown by the dotted line in Fig. 1.

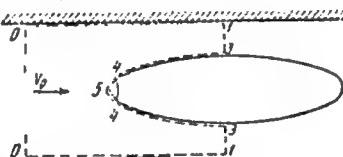

Figure 1.

Card 1/3

L 09400-67

ACC NR: AF6030114

Cross section 0-0 represents the flow far ahead of the body, and cross section 1-1 the middle of the cavity. Designating by V , p , and ρ the velocity, the pressure, and the density, we assume integral laws for the conservation of mass, and the change in the momentum imparted to the volume of the fluid included within the control surface. In projection on the axis of the tube we have

$$\int_{(S_0-S_1)_1} V dS = \int_{S_0} V dS \quad (1)$$

$$\rho \int_{(S_0-S_1)_1} V^2 dS - \rho \int_{S_0} V^2 dS = \int_{S_0} p dS - \int_{(S_0-S_1)_1} p dS - \int_{S_0} p dS - \int_{S_0} p dS$$

Here the subscripts indicate: 0—cross section 0-0; 1—cross section 1-1; S_0 —the boundary of the cavity; S_0 and S_1 —the areas of the transverse cross sections of the tube and the middle point of the cavity; S_{34} and S_{45} —the projection of the area of the lateral surface of the cavity from the breakaway point of the jet to the middle point, and the projection of the wetted surface of the body on the plane of the transverse cross section of the tube. Assuming that V_0 and p_0 are constant over the whole cross section, while the pressure p_1 is constant along the surface of the cavity, and designating by X the force due to the resistance of the body, we have:

$$\int_{(S_0-S_1)_1} V dS = V_0 S_0$$

$$\rho \int_{(S_0-S_1)_1} V^2 dS - \rho V_0^2 S_0 = p_0 S_0 - \int_{(S_0-S_1)_1} p dS - p_0 S_1 - X \quad (2)$$

TOPIC TAGS: army medicine, genitourinary system disease, tuberculosis

ABSTRACT: The article describes the treatment and clinical aspects of 220 cases treated at the Institute in the period 1957-1963. The disease developed quickly (1-2 days) in 61% of the cases; the cause in 47% remained unknown, in 12 it was due to an injury, in 14% to urological causes, and in 20% it was of tuberculous origin. Laboratory methods of diagnosis are described. Normally the disease required 9 days of hospital treatment, and several weeks of additional treatment at the Spa Institute. In 50% the cure was quick and complete; some of the aspects of residual difficulties are discussed. The author thanks Doctor J. Tuhý, Chief of the Urology Department UVN in Prague, for providing the case history documentation. Orig. art. has:4 tables. JPRS: 36,834

TITLE: Investigations in the Field of the Synthesis of Silicon-Organic Compounds (Issledovaniye v oblasti sinteza kremniyorganicheskikh sovedyeniy).
V. The Synthesis of Polysiloxanes With Combined Radicals (V. Polucheniye polisilosanov so smeshannymi radikalami).

PERIODICAL: Zhurnal Obshchey Khimii, 1957, Vol. 27, Nr 12, pp. 3321-3321. (USSR).

ABSTRACT: In the present work the authors try to explain the effect of polar substituents on the characteristics of polysiloxanes. For this purpose chloromethyl- and dichloromethyl derivatives of methyloxanes were produced by direct chlorination of the corresponding methylchlorosilanes with ultraviolet radiation with subsequent hydrolysis and polymerization. The chlorination of dimethyldichlorosilane was carried out according to data from publications by conducting the sulfuric acid dried chlorine through dimethyldichlorosilane in the stirring flash with ultraviolet radiation (quartzlamp with in the flask). After the direct chlorination of diethyl- and trimethylchlorosilane under these conditions the chlorinated final products were isolated. These, as well as their compounds with dimethyldichlorosilane after the hydrolyses with methylalcohol resulted in the corresponding polysiloxanes.

Card 1/2

Investigations in the Field of the Synthesis of Silicon-Organic Compounds. 79-12-28/43

V. The Synthesis of Polysiloxanes With Combined Radicals.

nes. The authors stated the better solubility of the hydrolysis products, which have chloromethyl derivatives, in water and methanol as well as their more complicated polycondensation compared with pure dimethylsiloxanes. The authors also showed that the presence of chloromethyl groups in the caoutchouc-type polysiloxanes causes a certain deterioration of the physico-mechanical parameters of rubber but makes it more resistible against frost. The authors assume that the chlorine atom could be replaced by the SH-group. There are 1 table, and 6 references, 1 of which is Slavic.

Separating Lubricants for Shell Molds (Razdelitel'nyye smazki
dlya obolochkovykh form)

PERIODICAL:

Liteynoye Proizvodstvo, 1958, Nr 6, p 27 (USSR)

ABSTRACT:

This article contains information on "SKT-2" and "SKT-3" lubri-
cants for shell molds. These lubricants are based on
methylsilicon vat residues, and are 10 to 12 times cheaper
than the ethylsilicon liquid No. 5 (TU MKhP 2416-50), which
previously was extensively used for shell molds. The new lu-
bricants are also more stable at high temperatures and cause no
scale on the surface of mold boards. They were developed by
the authors.

AUTHORS: Borisov, S. N., Karlin, A. V., Malysheva, T. A.

TITLE: Vulcanization of cyclic dimethyl- and diethylsiloxane copolymers

PERIODICAL: Kauchuk i rezina¹⁵, no. 11, 1961, 4 - 8

TEXT: A study was made of the effect of the benzoyl peroxide and (ZnO , TiO_2 , Fe_2O_3) metal oxide additions, on the thermal stability of vulcanizate mixtures based on dimethyldiethylsiloxane rubber. The possibility of using cyclic low-molecular dimethyl- and diethylsiloxanes instead of the formerly used individual methyltetramer and ethyltrimer, for the production of polydimethylidemethylsiloxane rubbers, was further investigated. It was found that the latter, synthesized by catalytic polymerization of cyclic dimethyl- and diethylsiloxane mixtures, do not differ in their properties from similar rubbers produced from the methyltetramer and ethyltetramer mixtures. The dimethylethylsiloxane polymers require a smaller quantity of benzoyl peroxide for the vulcanization than the CKT (SKS) rubber. Vulcanizates based on the mixtures of dimethyldiethylsiloxane rubbers, containing titanium dioxide instead of zinc oxide, retain their elasticity for long periods of time at 200 - 225°C, and for shorter periods at 250°C. They also have a high

Card 1/3

Vulcanization of...

frost resistance at -70°C. It is proven experimentally, on the example of ethylsiloxane polymers that the zinc oxide, usually contained in the rubber mixtures, increases their structuralizing processes. Since under stable conditions, the rates of polymerization of the hexaethylcyclotrisiloxane and octaethylcyclotetrasiloxane, under the effect of H₂SO₄, have the ratio of 1.84 : 1, and their weight ratio in the products of complete hydrolysis of diethyldichlorosilane, is also 70 - 75 : 30 - 25, it was assumed that the replacement of M₂-45 methylhydrolysate with M₂-4 fraction, and E₂-34 ethylhydrolysate with E₂-3 fraction, would have no significant effect on the conditions of production and properties of the dimethyl-diethylsiloxane elastomers, and would at the same time lower to a large extent the consumption coefficients of the initial monomers. The experimental polymerization was conducted in two different ways: under the action of concentrated sulfuric acid, and in the presence of an alkali. Although the mechanism of the protective action of iron oxide and titanium oxide was not established, attention is drawn to the high protective action of metal oxides with varying valencies on the siloxane rubbers. Experiments showed that iron oxide and titanium dioxide inhibit the oxidation process of the dimethyl-diethylsiloxane rubbers. Further data obtained showed that the addition of zinc oxide to the composition of the heating

TITLE: Ethyl siloxane elastomers. I. Copolymerization of octamethyl cyclotetrasiloxane with hexaethyl cyclotrisiloxane

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 3, no. 9, 1961,
1377-1382

TEXT: The highly heat-resistant polydimethyl siloxane (PDMS) rubbers are elastic up to 250-300°C and have a low glass transition temperature (-130°C). Replacement of CH₃ radicals by larger organic groups, e.g., methyl-phenyl siloxane, renders the polycrystallization difficult, improves the properties of the vulcanizate at low temperatures, but does not change the glass transition temperature. As a direct synthesis of methyl-phenyl siloxane is not possible, and silane chloride mixtures were formed on phenylation of methyl dichloro silane by the Grignard synthesis, whose separation was difficult, it was necessary to use better accessible monomers for the production of frost-resistance rubbers. The purpose of the present paper
Card 1/6

was the synthesis of methyl-ethyl siloxane elastomers on the basis of octamethyl cyclotetrasiloxane and hexaethyl cyclotrisiloxane. According to the nomenclature suggested by N. N. Sokolov (Metody sinteza poliorganosiloksanov (Methods of synthesis of polyorganosiloxanes), Gosenergoizdat, 1959, pp. 127-132) the former is denoted by M₂-4, the

latter by E₂-3. These two components, obtained by hydrolysis of dimethyl dichloro silane and diethyl dichloro silane, respectively, were co-polymerized in the cold in the presence of 2% by weight of concentrated H₂SO₄ under stirring for 5 hr with subsequent addition of 1% of weight of H₂O. At almost equimolecular initial ratio, co-polymerization takes place readily, forming rubber-like high-molecular polymers. Table 1 presents the properties of the resultant polydimethyl-diethyl siloxane rubbers. The molecular weights were determined by the equation derived by Burry-Korolev for high-molecular linear PDMS: $[\eta]_{\text{benzene}} = 2.15 \cdot 10^{-4} M^{0.65}$.

Filling and vulcanization were similar as with CKT(SKT) rubber (polymer = 100; powdered silica gel γ-333 (U-333) = 50; ZnO = 5; benzoyl peroxide = 2 parts by weight). The assigned and real content of dimethyl siloxane links in the polymers was determined indirectly by IR spectra on Card 2/6

the 1267 cm^{-1} band of the $\text{Si}-\text{CH}_3$ bond. With increasing content of diethyl siloxane chains in the copolymer, the elasticity of vulcanizates decreases in parallel to the decrease of their swelling in organic solvents. When $(\text{C}_2\text{H}_5)_2\text{SiO}$ (DE) > 15 mole%, no rubber-like vulcanizates were obtained by the treatment commonly used for SKT (10 min vulcanization in the press at 120°C ; 6 hr additional thermostat vulcanization at 200°C with a temperature rise of $1^\circ\text{C}/\text{min}$). If, however, the second stage (6 hr at 200°C) is omitted, compounds containing 45 mole% DE give rubber-like vulcanizates. With 1-15 mole% DE their strength corresponded to that of SKT vulcanizates, 10% DE vulcanizate was well elastic. They were more frost-resistant than SKT. The coefficient of frost resistant was ~ 1 at -60 to -70°C for rubbers with 6-10 mole% DE. Acid catalysts which required troublesome washing-out were replaced by alkaline catalysts: $\text{M}_2\text{-}4$ and $\text{E}_2\text{-}3$ (92 : 8) were polymerized under stirring and heating in a stream of dry N_2 on the reflux condenser in the presence of a catalyst from cyclodimethyl siloxanes and KOH. The properties of vulcanizates obtained with 0.0075% KOH practically correspond to those obtained with 2% H_2SO_4 . The authors thank

TITLE: Ethyl siloxane elastomers. III. Methyl-ethyl siloxane rubbers

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 4, no. 1, 1962, 74-79

TEXT: The preceding communication II was published in Kauchuk i rezina, no. 11, 4, 1961. To obtain rubbers which remain elastic even at low temperatures, C_2H_5 was partially substituted for the CH_3 group in polydimethylsiloxane rubber. N. S. Shvarts catalytically synthesized the methyl-ethyl-dichlorosilane from methyl-dichlorosilane and ethylene: boiling point $99.3 - 100^{\circ}C/756$ mm Hg; $n_D^{20} = 1.4189$; $d_4^{20} = 1.0612$, $MR_D = 34.01$. From aqueous-alcoholic hydrolysis of this monomer the following was obtained (total yield 63% by weight): 1,3,5-trimethyl-1,3,5-triethyl-cyclo-

Card 1/43

Ethyl siloxane elastomers. ...

trisiloxane (I) (b. p. 78 - 78.4°C/10 mm Hg, $n_D^{20} = 1.4108$; $d_4^{20} = 0.9457$, $MR_D = 69.43$, $\eta^{20} = 2.00$ cp) and 1,3,5,7-tetramethyl-1,3,5,7-tetraethyl-cyclo-tetrasiloxane (II) (b. p. 110 - 111°C/10 mm Hg; $n_D^{20} = 1.4161$; $d_4^{20} = 0.9548$; $MR_D = 92.75$, $\eta^{20} = 4.29$ cp). Under the action of acid or alkaline catalysts (H_2SO_4 or KOH), new, high-molecular, rubber-like polymers resulted from copolymerizing cyclic methyl-ethyl- and dimethyl siloxanes (ratio 96 : 4 to 84 : 16). These polymers contain $(CH_3)_2SiO$ and $CH_3C_2H_5SiO$ links having molecular weights from 260,000 to 973,000. The samples vulcanized with 1 part by weight of benzoyl peroxide, 2 parts by weight of TiO_2 , 50 parts by weight of powdered silica gel per 100 parts by weight of polymer showed resistance to frost increased with increasing content of $CH_3C_2H_5SiO$ links (Fig. 1). After 10 days' heating at 200°C, tensile strength was 41 kg/cm²; relative elongation 230%. Comparison with diethyl- and methyl-phenyl siloxane rubbers showed for the resistance to

Simultaneous polymerization of ...

paste of the catalyst in siloxane oil, for 5 hours at 100°C; (c) catalyst based on potassium siloxanolates for 3 hours at 140°C in a current of dry nitrogen. The increase of the M₂-5 content from 10

to 90% lowers the molecular weight of the elastomers from 700,000 to 500,000 roughly. This increase leads also to a somewhat higher relative elongation and freezing resistance coefficients in the vulcanized resins. These influences are less pronounced when method (b) is used. The polymers obtained by this method are of a higher molecular weight than those obtained by method (a). The conversion in both methods was more than 90%. The conversion in the alkaline method (c) was lower. With the increase of the M₂-5 content from

10 to 90% the amount of volatiles increased from 14 to 17%. The properties of the resins prepared by the 3 methods were comparable. It is concluded that the differences induced by the varying composition of the starting mixture are practically insignificant. There are 7 references: 5 Soviet-bloc and 2 non-Soviet-bloc. TITLE: Properties of ethylphenylsiloxane rubbers

PERIODICAL: Kauchuk i rezina, no. 6, 1962, 3 - 6

TEXT: The relation between the methylphenylsiloxane ring content in rubbers and their optimum frost resistance was determined by producing and investigating polymers containing from 2 to 10 mol % of the methylphenylsiloxane rings. Optimum frost resistance was found in rubbers based on polymers and containing 8 mol % methylphenylsiloxane rings. The substitution of the latter with diethylsiloxane rings yields elastomers with the following characteristics: a) the ability to vulcanize with lesser quantities of benzoyl peroxide and with weak vulcanizing agents, such as dicumyl peroxide; b) a higher resistance to accumulation of residual deformations after compression; c) resistance to destruction in closed systems. A study of synthesized ethylphenylsiloxane elastomers showed that they combine the advantages of both the diethylsiloxane and methylphenylsiloxane elas-

Card 1/2

Properties of....

tomers. They vulcanize with a lesser quantity of benzoyl peroxide and dicumyl peroxide, as compared to the methylphenylsiloxane rubbers. They have a higher resistance to destruction in closed systems and regeneration capacity after simultaneous action of elevated temperatures and loads. The rubbers based on the ethylphenylsiloxane polymers are equal to the methylphenylsiloxane rubbers in their thermal and frost resistance, within a temperature range of -100 to +250°C. The properties of ethylphenylsiloxane rubbers are improved by substituting the Y-333 (U-333) silica gel with the more active EC-280 (BS-280). There are 2 tables and 3 figures.

ABSTRACT: Because the properties of dimethylsiloxane rubber are greatly affected by the purity of the monomer, a process for making pure dimethylcyclosiloxanes (DMCS) was developed at VNIIISK. The process is based on the difference in the behavior of DMCS and their trifunctional contaminants in the presence of aqueous KOH. The difference is that while the contaminants polymerize irreversibly, the DMCS enter the equilibrium: polymer - reversible reaction - DMCS, which is shifted to the right on DMCS distillation. Preliminary laboratory and pilot-plant studies of the hydrolysis of impure dimethyldichlorosilane (DDS) and of

the depolymerization of the hydrolyzate were carried out. It was shown that the latter's composition and properties are determined not only by the DDS/water ratio and reaction temperature but also to a great extent by the agitation rate. The following process was developed: DDS and water in a 1/2 ratio are fed continuously to a cooled, stirred vessel where DDS hydrolyzes at 20C; after separation from the 2% HCl formed, the hydrolyzate is neutralized; the neutralized hydrolyzate is depolymerized with 50% KOH as the DMCS are distilled off (laboratory conditions, 20 mm Hg and a pot temperature of 90 to 100C). After drying, the distilled DMCS, whose trifunctional compound content is equal to or less than 0.02 mol %, are used to make SKT rubber. When the hydrolyzate volume reaches 1/150 of its initial value, the residue is further depolymerized (laboratory pot temperature, 150 to 190C) to distill a second DMCS fraction from the irreversible-polymer residue. The SKT rubber met VTU LU 51-57 specifications. Orig. art. has: 9 figures, 3 formulas, and 1 table. 15

TITLE: Thermal stability of siloxane rubbers obtained with acid or alkaline catalysts

SOURCE: Kauchuk i rezina, no. 8, 1965, 6-8

TOPIC TAGS: organosilicon compound, siloxane, rubber, thermal stability, catalytic polymerization, synthetic rubber, siloxane rubber, acid catalyst, alkaline catalyst, catalyst removal, thermal stability improvement, silicone rubber

ABSTRACT: The presence of residual alkaline or acid catalysts used for the polymerization of organocyclosiloxanes impairs the thermal stability of the siloxane rubbers obtained. The results of a study on the effect of such catalysts and methods for their removal from the final products are given in the paper. Samples of vinyl group-containing dimethylsiloxane rubbers SKTV and SKTV-1 were used which differed in the content of methylvinylsiloxane repeat units (from 0.1 to 0.5 mol%). The following catalysts were used: potassium polydimethylsiloxanediolate, alkaline; tetramethylammonium polydimethylsiloxanediolate, alkaline, thermally decomposable; aluminum

sulfate in polysiloxane paste, acid. The following treatments were applied for removal of the catalyst from the final product after polymerization: washing with water, neutralization either with ferric hydroxide (GOST 4150-48) or U-333 white filler, heating under vacuum, or reprecipitation. It was found that the thermal stability of polysiloxane rubbers freed from the catalyst by water wash is considerably impaired under thermo-oxidative conditions. The other treatments mentioned above produce better results. It was also found that the above siloxane rubbers, obtained by polymerization with alkaline catalyst, are as good as the acid catalyst rubbers with respect to thermal stability both under vacuum and in air. A comparison of the thermal stabilities of unwashed and washed samples which were subsequently neutralized with U-333 white filler indicated that their thermal stabilities were nearly the same. It was assumed that the residual alkaline catalyst is blocked by white filler and does not affect the thermal stability of the rubber. The thermal stability of the samples was determined by weight loss. Orig. art. has: 3 figures and 1 table.

TITLE: Method for obtaining low-molecular weight α, ω -dihydroxypolysiloxanes.
Class 39, No. 184453

SOURCE: Izobret prom obraz tov zn, no. 15, 1966, 90

TOPIC TAGS: siloxane, water, polymerization, basic catalysis, catalysis

ABSTRACT: This Author Certificate presents a method for obtaining low-molecular weight α, ω -dihydroxypolysiloxanes from cyclosiloxanes, e.g., octamethylcyclotetrasiloxane or dimethyl phenylcyclosiloxane at high temperatures and pressures. To simplify the process, the cyclosiloxane is reacted directly with water in the presence of catalytic amounts of alkali.
